PROFESSIONAL DIODE LASER HAIR REMOVAL

Painless - Fast - Effective

Never Shave or Wax Again

Elysion is the most advanced laser for hair removal. With high Peak power and patented cooling it offers many advantages over other lasers or systems and can offer permanent and painless removal of unwanted hair at the speed of light.

How does laser hair removal work?

Specific wavelengths of laser light are selectively absorbed by melanin, the dark pigment which surrounds the hair follicle. The laser heats the follicle and disables the follicle at the root causing the hair to fall out permanently. Elysion uses the optimal wavelength to deliver high energy ensuring best results.

Is it painful?

Elysion laser uses an integrated patented crystal freeze technology to keep the skin surface at a constant 5 degrees thereby protecting the skin and ensuring a very comfortable treatment. Elysion also has a dynamic mode for truly painless treatment.

How many treatments are required?

All lasers can only treat hair in the growing stage, or visible on the surface of the skin. At one point this represents approximately 30% of all hairs in the skin. The other hairs are dormant. There are three phases of hair growth and we need to treat all three phases for maximum clearance.

Due to its ability to deliver high energy specifically to the hair follicle, the results from Elysion are superior and can achieve maximum results in approximately 6 sessions. Other lower power lasers or IPLs can take 8 to 12 sessions.

Is it Permanent?

Not all laser or IPL systems offer permanent hair removal but Elysion, due to its high power and effective cooling technology can remove hair permanently. The hair treated with Elysion will not grow back. However any future hormonal changes may result into new growth and require additional treatment in the future.

How Much Does It Cost?

Elysion is one of the fastest lasers for hair removal so our prices are very competitive. Please refer to our price list for your information and offers.
